

Vino0244 !place Command

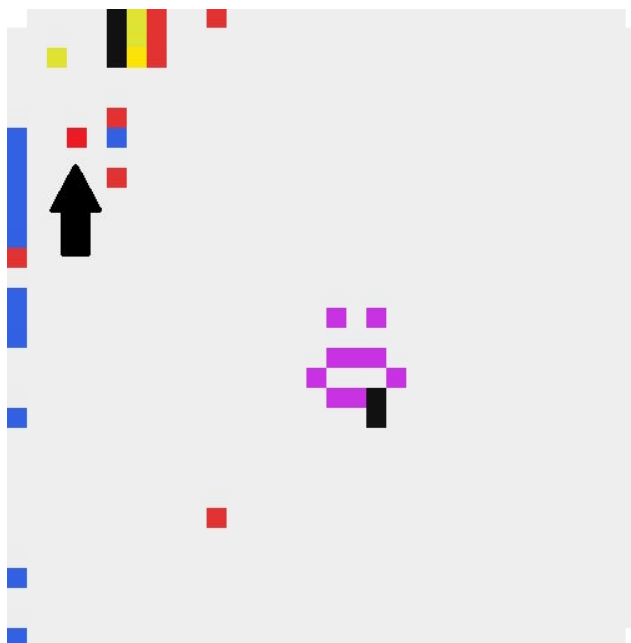

The Vino0244 !place concept is very simple. Each viewer can change a pixel in the Place Canvas to whatever color they want every 3 minutes. It is done using the !place command in chat using this format: !place [color] [x] [y]. For example, if I wanted to place a red pixel 4 pixels from the left side of the canvas and 7 pixels from the top, I would type this in chat:

!place red 4 7

Or if I wanted to use hexadecimal:

!place #ee1111 4 7

Why use !place?

Place is the ultimate way to engage your audience! It gives your community something to work towards, laying down their mark and making them feel like they have an influence. Because Place is used by multiple streamer communities, the incentive to “battle” other communities and defend your own can arise.

All this can be especially helpful if what you stream can have dips in engagement or excitement. Place helps ensure viewer retainment in these situations.

How to integrate !place into your stream

It's extremely easy! To have the Place Canvas appear as an element in OBS, simply open a "browser" element and copy this url into the URL section: <http://vino0244.xyz/place/> . Then, make sure to set the Width to 601 and the Height to 600. And there you have it! It should be working at this point, but if you have any questions feel free to ask at evnowork@gmail.com for help.

To have access to the !place command in your chat, just confirm that you wish to have it by emailing me at evnowork@gmail.com or you could whisper me on twitch as well at <https://twitch.tv/vino0244/> . Once confirmed, I will add you to the list of channels for the wafflecone bot to access. After that, everything should be working and you should be all set!
